Previous Work

Hwang, Gwan-Hwan, Wei-Sian Huang, and Jenn-Zjone Peng. "Real-time proof of violation for cloud storage." Cloud Computing Technology and Science (CloudCom), 2014 IEEE 6th International Conference on. IEEE, 2014.

POV - Proof of Violation

定義以下三個 Tuples:

- Properties
  - Data Integrity
  - Write Serializability
  - Read Freshness
- A cryptographic accountability protocol (CAP)
  - 在 User 和 Service Provider 之間交換的訊息加上簽章,
    藉由此 Cryptographic Proof 讓雙方不可否認自己做過的事
- Auditing
  - 利用收集的 Cryptographic Proof 來證明是否違反 Properties

Real-time Proof of Violation for Cloud Storage

2014 IEEE 6th International Conference on Cloud Computing Technology and Science

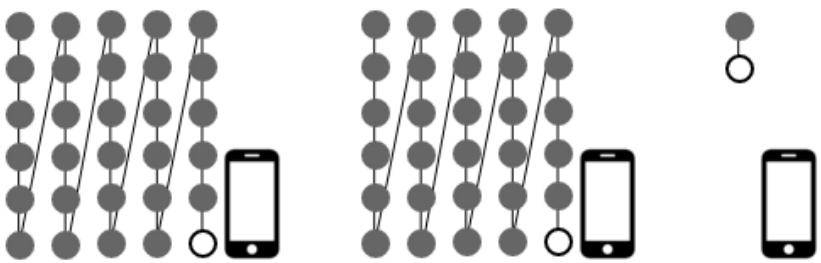
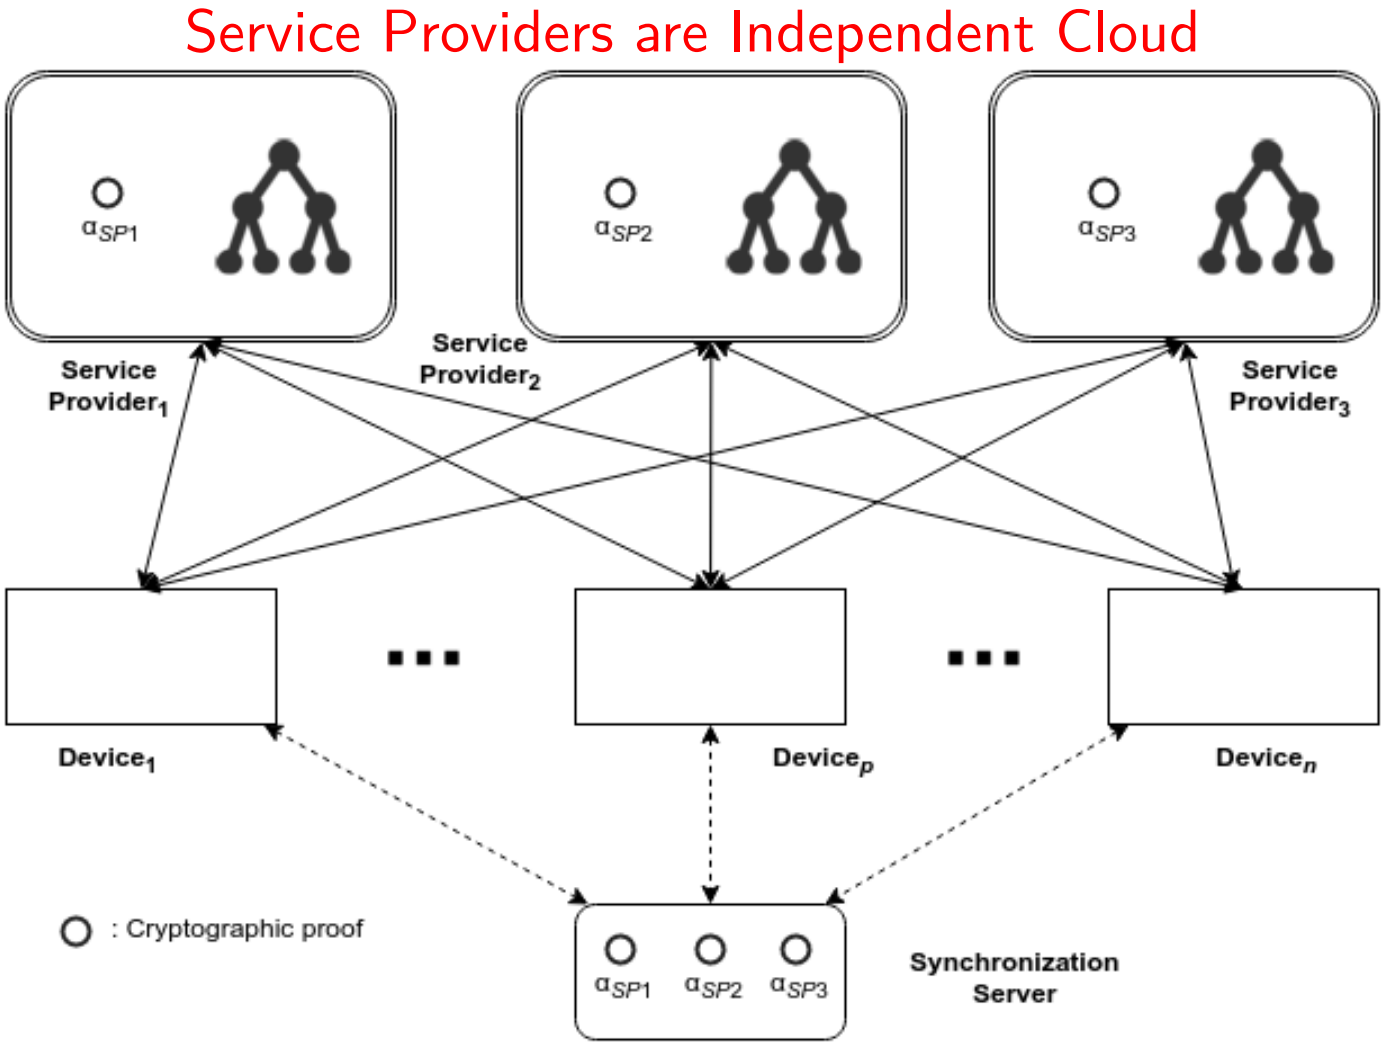
Worst-case

若有個 device 很久沒有使用
需要花很長的時間將 merkle tree 更新到最新
累積的 hash chain 越長，使用者等待的時間越久



System Architecture

Assumption: 同時有 k 個 server 回傳錯誤結果的機率 ≈ 0

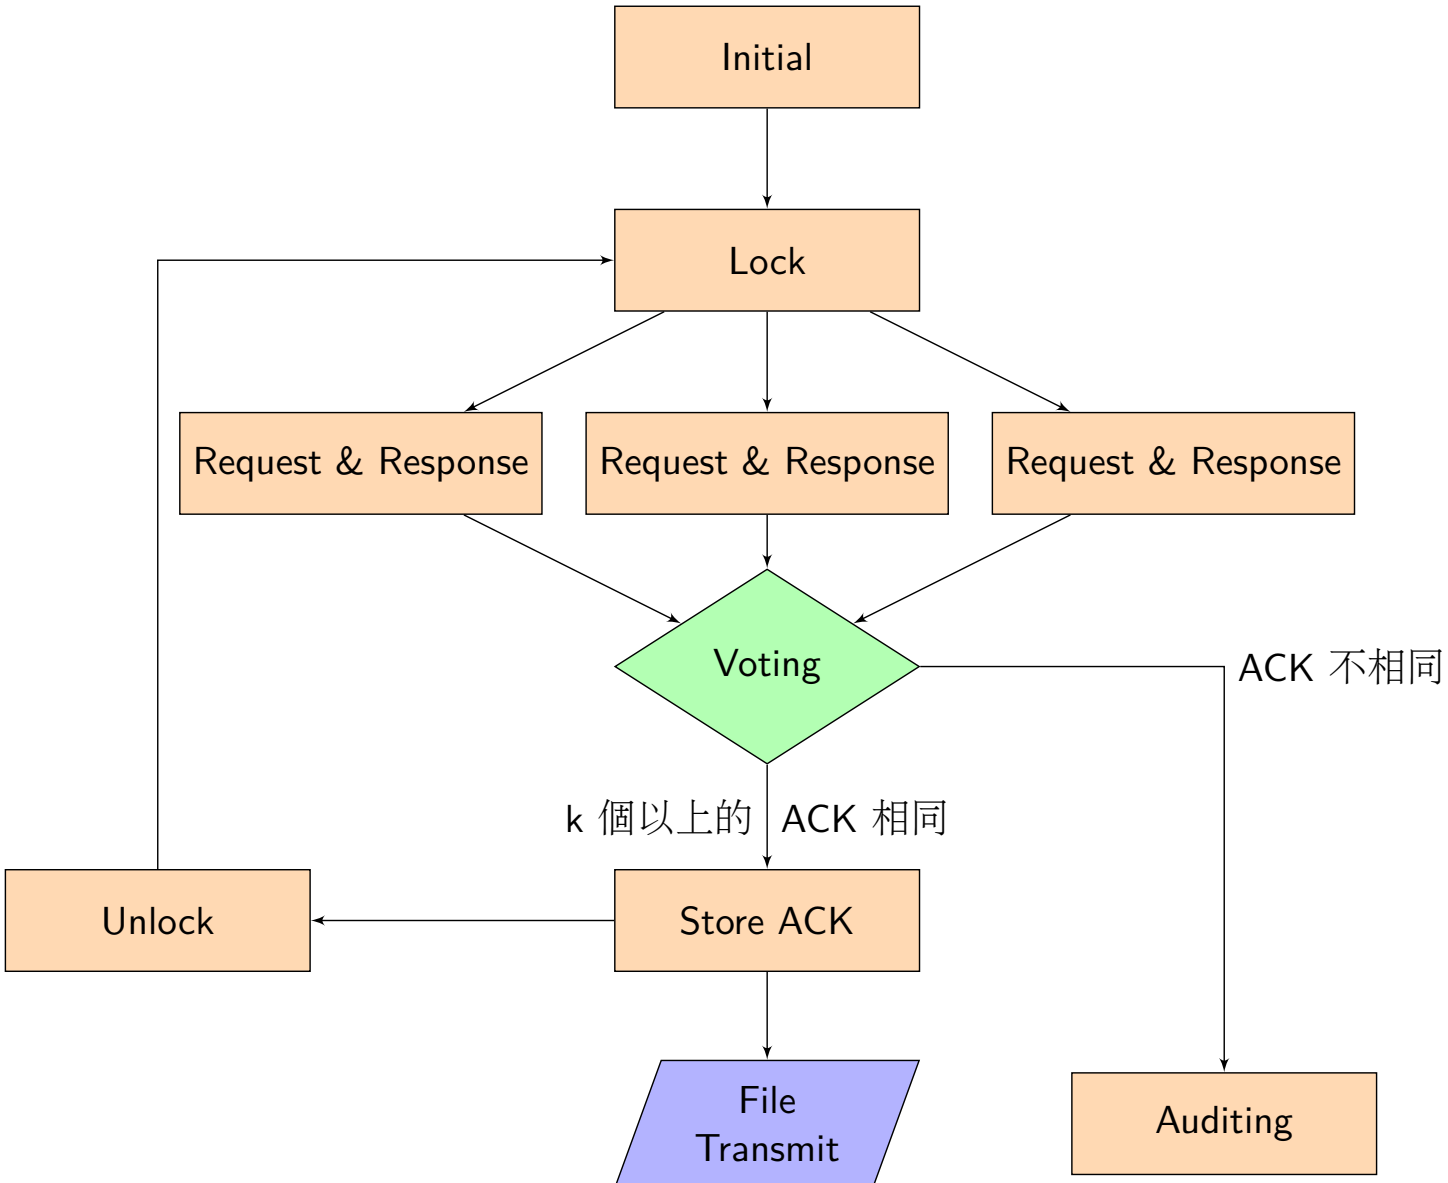


Comparison

- Pros
  1. Device 節省了儲存 Merkle tree 的空間
  2. Device 不需要計算新的 Roothash 將會節省時間
  3. 每一次更新資料都會即時的備份
  4. 不會有之前的 Worst-case

- Cons
  1. 需要傳送多份 Request, 處理多份 Response
  2. 需要使用較多的 Service Provider

Flowchart



Initial

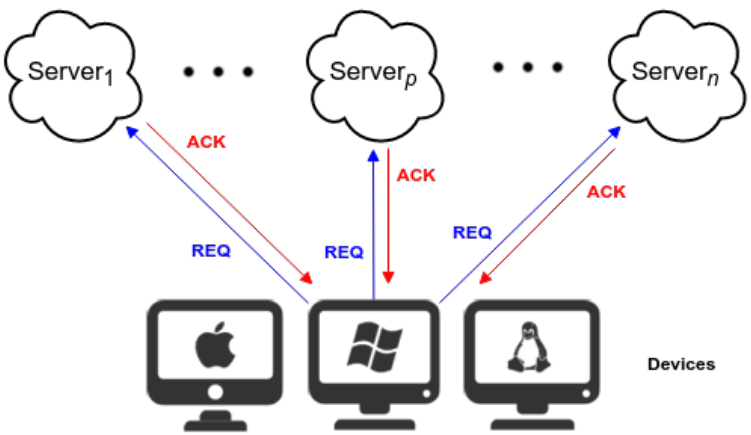
File Transmit
Auditing

Download & Upload

Request & Response



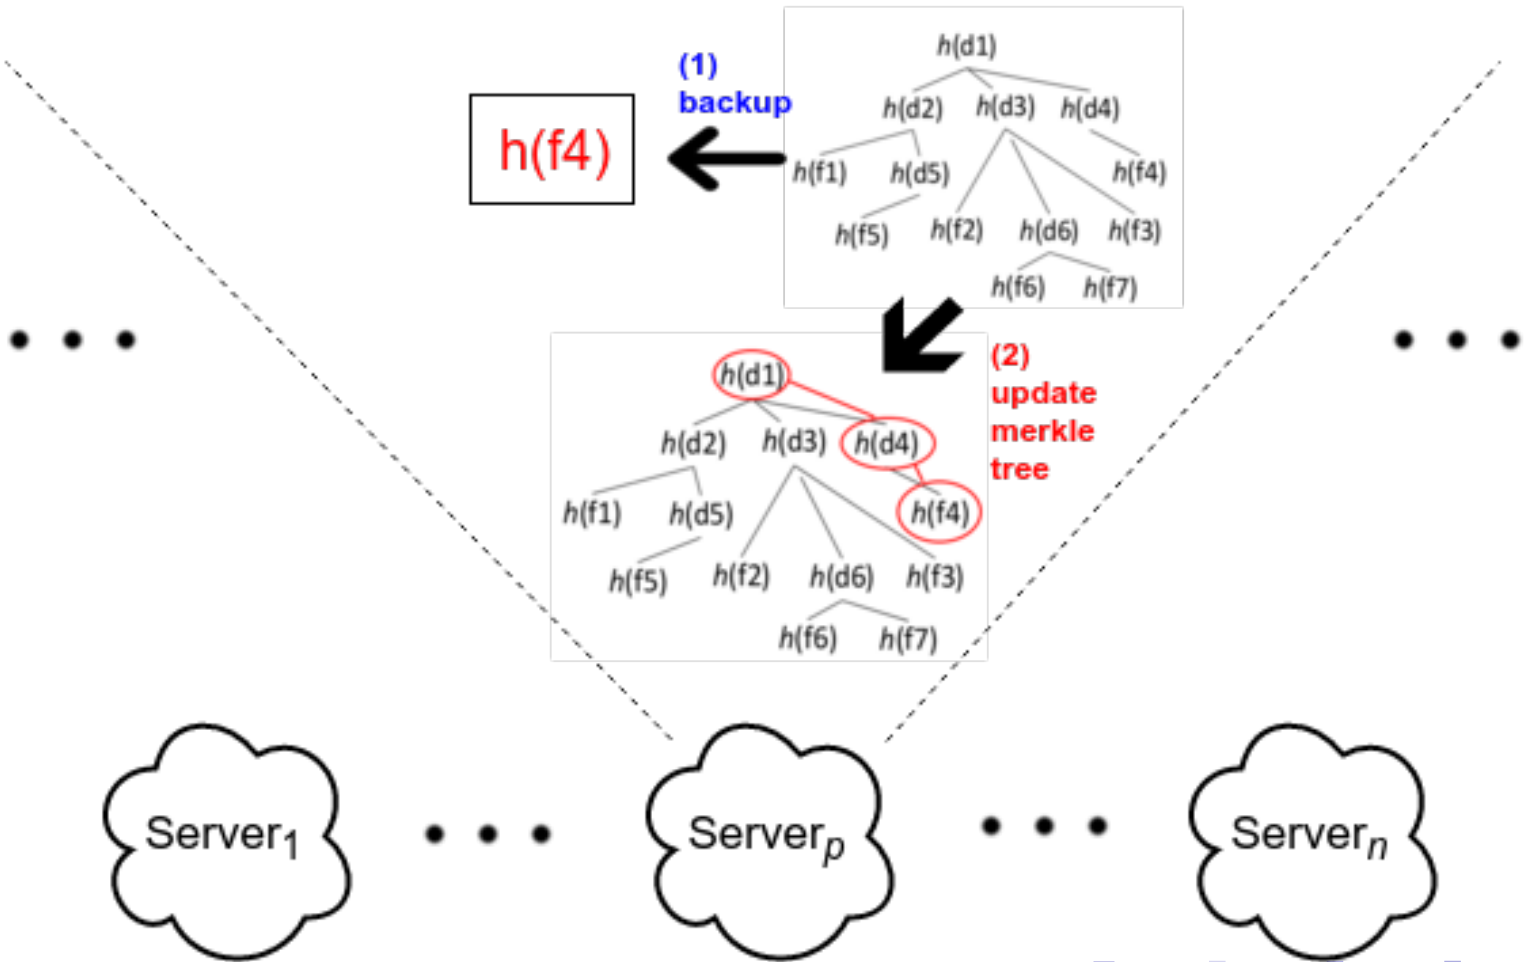
$$REQ = (OP,\ [OP]_{pri(D)})$$
$$OP = (TYPE,\ PATH,\ HASH,\ SN)$$
$$SN = \textit{Sequence Number}$$

$$ACK = (RESULT,\ REQ,\ [RESULT,\ REQ]_{pri(S)})$$
$$RESULT = (roothash,\ filehash)$$

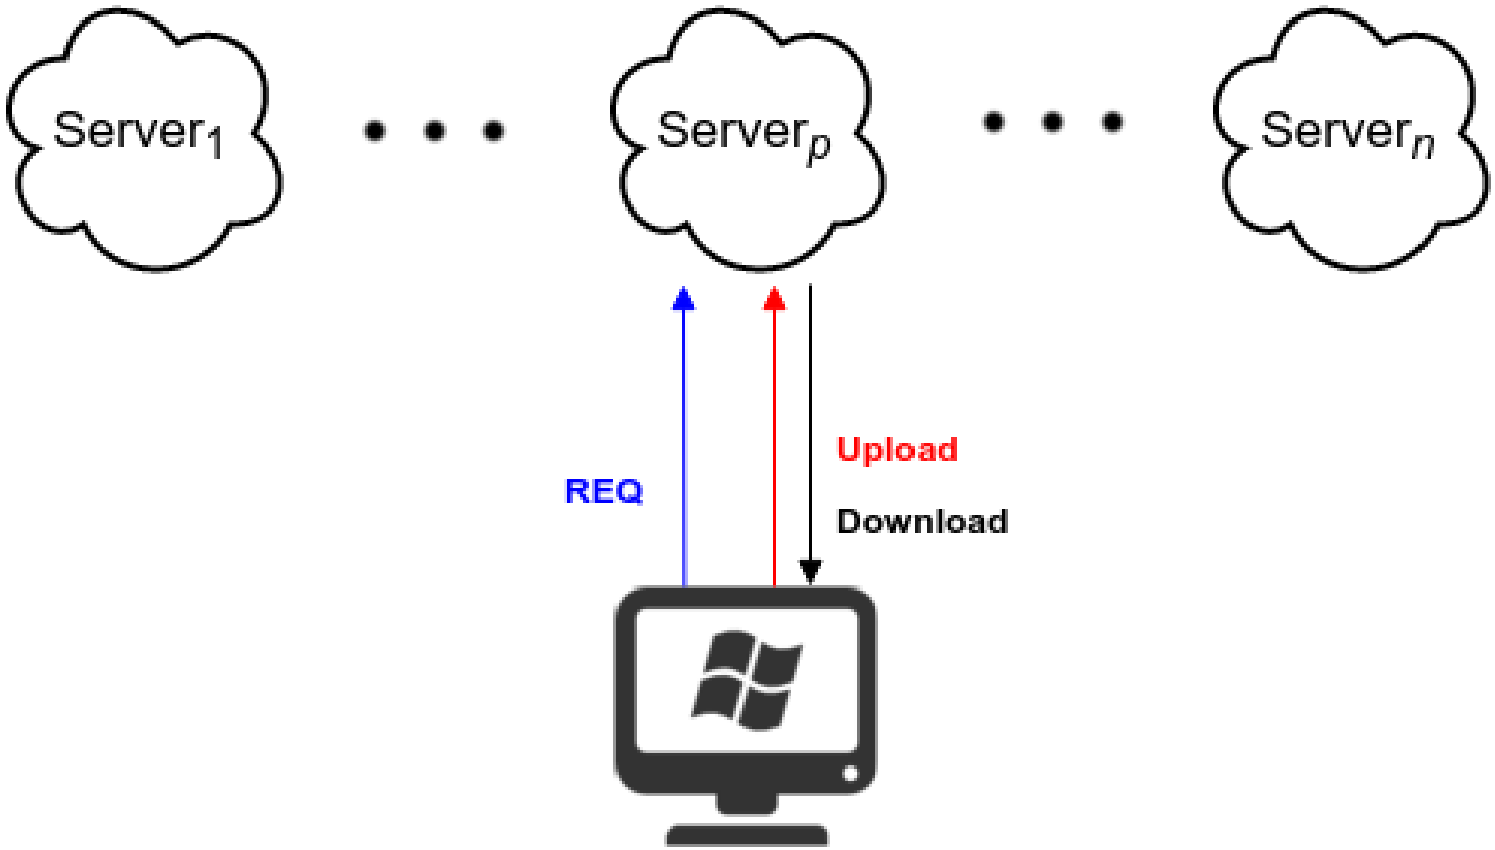
collect ACKs and voting

if Operation is UPLOAD

Servers Update Merkle tree



File Transmit



Audit

device request OP_i，收到回傳的 ACK_i
發現 $Server_p$ 的 ACK 有錯誤，因此向 $Server_p$ 稽核

device 向 $Server_p$ 索取 MT_{i-1}
(MT_{i-1} 為執行 OP_i 之前的 Merkle tree)

①② 兩點有一個出錯就能證明 $Server_p$ 出錯

[證明 i 之前的動作都沒問題]

① device 檢查 MT_{i-1} 的 roothash，應和 ACK_{i-1} 中紀錄的相同

[證明第 i 個動作沒問題]

② device 以 OP_i 中的 hash value 來更新 MT_{i-1}，
更新後的 roothash 應和 $Server_p$ 現在的 roothash 相同

Conclusion

我們提出了一個應用於雲端儲存的 Real-time POV 技術，利用投票的方式快速檢查 Data Integrity，也即時的將資料備份到多個 Server 上

實驗結果顯示，相較於之前的 Real-time POV 技術，平均能夠節省 8 倍的時間，Worst-case 時更能夠節省超過 20 倍的時間。

雲端儲存系統可以使用本論文提出的方法，提供雙方不可否認的保證於他們的服務層級協議 (SLA) 中

Future Work

1. 我們希望能將 FBH 樹套用到本論文的方法中，藉由實驗觀察能否增快 Merkle tree 在更新檔案時的速度。

2. 在本論文中使用同步伺服器來維護 Write Serializability，若有新的演算法能夠不需依賴同步伺服器又能維護 Write Serializability，將能讓我們的架構更加彈性且使用更少的硬體。

Thanks for Your Listening
